Abstract- Multilingual Machine Translation is a computerized system that is designed to translate source text from various natural languages into target text of another natural languages. Due to increased need of global communication, multilingual machine translation is the propel for researchers. With the advancement in technology, now we have computerized systems that can replace the human experts in particular domains. One such popularly adopted domain by researchers is artificial intelligence (AI) and NLP. Natural language processing (NLP) is a field of computer science concerned with the interaction between computer and human (natural) languages. It is becoming one of the most active area in the interaction between human and computer. These includes text system that integrate text and natural language. Machine translation (MT) system is available mostly for a specific language pair. Recently many MT systems are being designed for bilingual pairs. And the research is heading towards developing MT systems that are capable of handling more than two language pairs i.e. multilingual. MT systems still has so many issues to deal with. Recently developed multilingual systems are laden with the enormous size corpus. In this proposed system we are analyzing machine translation system using NLTK.

Index terms- Machine translation, NLP (Natural Language Processing), NLTK (Natural Language Tool Kit), AI (Artificial Intelligence), Text to Speech.

1. INTRODUCTION

The main purpose of Natural Language Processing is for an English sentence to be interpreted by the computer and appropriate action taken. Despite the challenges, natural language processing is widely regarded as a promising and critically important set out in the field of computer research. The applications that will be possible when NLP capabilities are fully realized are impressive computers would be able to process natural language, translating languages accurately and in real time, or extracting and summarizing information from a variety of data sources, depending on the users' requests. This system focuses on the solution of the problems arising in the analysis or generation of Natural language text, such as syntactic and semantic analysis or compilation of dictionaries and grammars necessary for such analysis. It proposes the architecture for translating Natural language Hindi to English.

2. LITERATURE SURVEY

According to the traditional Systems and prior research, the methodologies and technologies used for translation are giving below in the table.

<table>
<thead>
<tr>
<th>Sr. no</th>
<th>Paper name</th>
<th>published year</th>
<th>Technique used</th>
</tr>
</thead>
<tbody>

3. TECHNOLOGY USED

Python: Python is an interpreted, high-level, general-purpose programming language.

NLTK: NLTK3 library for python will be used for input stemming. This library serves as a toolkit for computational linguistics. Following is a list of the modules we will be using.

Token module provides basic classes for processing individual elements of text, such as words, or sentences. NLTK tokenize is used to tokenize incoming sentences. The words net lemmatize and porter stemmer is used parse the input’s base words for comparison.

4. OBJECTIVE
The objective of our project is to translate into accurate and English sentence after parsing natural language using open source tools i.e NLTK and libraries. Users will be able to obtain English statement when the given input is Hindi.

Flowchart:

Figure 1: Flowchart of Hindi to English translation

SYSTEM ARCHITECTURE:

Working Process:
- The first step in translation is to split the sentence into words or simple sentences.
- If a part of the input is in the example database then we keep that part as it is and the remaining part is segmented into words.
- When the segmentation is done, segments are actually translated and tagged independently.
- If the segment is example based, it is directly converted to English.
- Further, the remaining words are translated using the parallel Hindi-English Dictionary.

<td>हमारी कक्षा में पंचायत लड़के हैं।</td>
<td>OUR CLASS CONSISTS OF FIFTY BOYS.</td>
</tr>
<tr>
<td>विकास में विकास किया</td>
<td>VIKAS DID DEVELOPMENT</td>
</tr>
</tbody>
</table>

6. CONCLUSION

Hybrid model of translation (HMT) system is able to outperform many baseline translation systems based on direct, RBMT and SMT approaches individually. Currently it is not giving the good result on complex and multiple combine sentences. By using this method the user can get the output.
